Security Through AutoClassification

PowerHouse™ AutoClassification Digitizes & Secures Classified Documents

For this multi-million dollar, Massachusetts-based, Department of Defense contractor, security is always the number one priority.

Working on top-secret projects for the US Government for decades, including several guidance systems, this client must be proactive in safeguarding documents containing our nation's military secrets. Consequently, they need a security-minded, high quality solutions provider who can handle transforming their paper documents into digital assets, pulling their records management and Information Governance into the modern era. Furthermore, all digital assets must also have complete metadata coding to comply with DOD content storage policies.

The client chose Valora Technologies and our PowerHouse AutoClassification platform for several reasons. First, PowerHouse supports full document digitization, including scanning, text creation via OCR, logical document unitization, AutoCoding and Rules-Based dispositioning of content, enabling compliance with the DOD's strict policies. Second, since Valora built PowerHouse from the ground up, we have unrivalled ability to adapt the software to specific client environments, such as native connectivity with existing systems. Finally, with over a decade of experience provisioning complex, paper-oriented services work for a wide swath of federal and state government agencies, Valora provided an unparalleled catalog of agency references and past performance reporting.

PowerHouse Connectors

PowerHouse natively connects to the following enterprise applications:

- SharePoint
- Microsoft Exchange Server Online (Office 365)
- UltiPro
- Relativity
- Alfresco
- iManage
- iConect
- Catalyst
- Ringtail

Upon selection as the winning bidder, the Valora team, physical facilities and data management policies underwent several intense security audits to ensure our personnel, facility and policies met the stringent requirements for a major DOD contractor. A small sampling of such measures include: federal security clearance for all staff, outfitting our transportation fleet with GPS-monitoring, adding bio-authentication to enter our facility and installing additional security devices throughout our processing center.

The services Valora provisions for this client vary from sending Production staff onsite to scan highly classified documents, to receiving rolling boxes of documents on a continued basis to scan, code and disposition, sending back newly created metadata, digital copies of documents, and the original boxes.

As an added bonus, the Client's Records & Information Manager notes, "we are excited to work with a local, woman-owned business that surpassed all our expectations to meet some demanding needs."
