BlackCat

MetaData Management & Data Visualization

Easily manage data and document control, reporting and analytics in a secure, private web-browser environment.

BlackCat™ is your central command center for managing large and disparate silos of data across an enterprise. With a rich yet simple display, BlackCat lets users manipulate and manage files via *metadata*, instead of having to open or even know about every single file that matches their search or retrieval criteria. BlackCat serves as the user-friendly front end to PowerHouse, Valora's AutoClassification platform.

VALORA'S BLACKCAT PLATFORM

can analyze virtually unlimited volumes of corporate data with unmatched classification and disposition capabilities. PowerHouse has been validated by corporations, government agencies and professional services firms worldwide.

Command & Control Across Data Silos

BlackCat is the centralized command & control center for multiple data silos. BlackCat provides full access and control of rich metadata across all of your files, shared drives, repository servers, email servers, cloud-based storage, and other data sources in use across your enterprise.

File Population Characteristics at a Glance

With its rich array of charts, graphics, social networks, heat maps and search, BlackCat instantly and intuitively tells you what your data population holds and how it is being managed. Ideal for Information Governance, BlackCat displays for analysis, retention, security and compliance come standard, with customization options for specific line-of-business requirements.

Easy Retrieval with Multi-Faceted Drill-downs

BlackCat displays a wealth of file and population attribute data in a chart-rich data dashboard called First Look. Easily drill down by Document Type, Dates, Authors & Custodians and other key metadata. No need for complex Boolean searches (though they are also supported), just point & click & go! BlackCat supports standard and customized metadata, with full, native integration with Valora's PowerHouse AutoClassification platform.

## Different Users, Different Data Display

BlackCat supports ultimate metadata customization with different views for different types of users. Separate interfaces, display and features for power users, basic users and admins. Powerful system administration to control who sees what and when, including customized AutoRedactions and content-level security control. With no client-side software requirements, BlackCat easily extends to the full organization for complete self-serve analysis and retrieval.
